

Interpreting Space and Place: An Introduction to Archaeological GIS

Lecture 08
Space, Place and Landscape: Identity

Interpreting Space and Place: An Introduction to Archaeological GIS

Lecture 08
Gonzalo – Perception of the Landscape

Recent technological advancements skew our perception of time and space, but other cultures probably do not share such perceptions

This has resulted in a 'compression of time and space' for those of us in the modern world, an understanding of the now in other places...

Goal: show how one group conceptualizes time and space on the landscape

Appadurai – social sciences consider native so much a part of their natural study as to be confined by it

Gonzalo – Perception of the Landscape

Recent technological advancements skew our perception of time and space, but other cultures probably do not share such perceptions

This has resulted in a 'compression of time and space' for those of us in the modern world, an understanding of the now in other places...

Goal: show how one group conceptualizes time and space on the landscape

Appadurai – social sciences consider native so much a part of their natural study as to be confined by it

Even for the West, we now understand that space is personal and 'man-made'

Q'eqchi' – Mayan-speaking people in modern-day Guatemala

Myth employs space: land or space are not different to landscape
Everything is living, remember Brady and Ashmore and van de Guchte's chapters
Relationship with landscape is essential to human relationships

Interpreting Space and Place: An Introduction to Archaeological GIS

Lecture 08

Snead and Preucel – Ideology of Settlement

When archaeologists moved away from an ecosystems approach and realized the constructed nature of landscape, land's use as a resource took on symbolic dimensions

This new approach as generated new methods (think epistemology and methods)

Findings of their research into a 500 year period through two case studies
- continuity of well-developed shrine systems as place-making process

- meaningful aspects of the physical world (those parts associated with supernatural entities) were re-created at the local

- the natural world was 'domesticized' in a similar way that class structures are naturalized in order to justify the ruling elite's position in society (religious/group leaders associating their houses with mythical spaces)

- society used the landscape as a means to preserve group identity for nearly half a millennium

Interpreting Space and Place: An Introduction to Archaeological GIS

Lecture 08

Barnes – Buddhist Landscapes

The ambiguity of meaning in relation to various landscape points

Buddhist landscapes in East Asia are often the result of intentional markings

- 1) earthly
- 2) other-worldly

The movement of sculpture out-of-doors transports visitors to other levels of consciousness

Buddhist statures themselves are the result of cultures meeting

Theravada – monastic style enlightenment; less visible representation

Mahayana – enlightenment for the masses; recognizable representation

Tantric – the most complicated, symbolic version; difficult to represent

Over time, the basic symbols of cave (where the Buddha spent time) and mountain (considered supernatural in Chinese folk beliefs, particularly Daoists) mixed in a way to write upon the entire landscape the various forms of Buddhism that spread throughout Asia, and involved the masses through physically inscribing such symbols on the real-world version
